What is Microsoft Foundry?

Microsoft Foundry unifies agents, models, and tools under a single management grouping with built-in enterprise-readiness capabilities including tracing, monitoring, evaluations, and customizable enterprise setup configurations. The platform provides streamlined management through unified role-based access control (RBAC), networking, and policies under one Azure resource provider namespace.

> **Tip**
>
> - Coming from Azure OpenAI? Upgrade your Azure OpenAI resource to a Foundry resource while preserving your endpoint, API keys, and existing state.
> - Using hub-based projects? Hub-based projects are accessible in the Foundry (classic) portal. New investments are focused on Foundry projects in the new portal.

Get started

Build your first agent in minutes, or open the portal to explore models and tools.

Build with models and agents

Open the Foundry portal | Get an Azure account

What you can build

Expand table

Capability	Description
Agents	Build declarative prompt agents and managed voice-based prompt agents in the portal or SDK, or deploy hosted agents that run your own code. Learn more in Foundry Agent Service.
Models	Access more than 10,000 models from Microsoft, OpenAI, Anthropic, Meta, and others. Browse the Foundry Models catalog.
Tools and knowledge	Extend agents with built-in tools, memory, and retrieval using a Foundry Toolbox.
